CHAPTER 1. Linear systems.....	7
1.1. Linear systems description and analysis with the help of differential equations.....	9
1.1.1. General notions on automatic control.....	9
1.1.2. Differential equations. Linearization	9
1.1.3.Component definition of automatic system control and mathematic description of linear component properties.....	12
1.2. Systems description and analysis with the help of impulse response functions.....	14
1.2.1. Block transfer function.....	16
1.2.2. Impulse response characteristic.....	17
1.2.3. Impulse response function(weight function – Green's function)...	
1.3. Spectral signal representation.....	18
1.3.1 Bode plot.....	22
1.3.2. Correlation between component input and output variables in steady-state.....	26
1.3.3. Steady and minimal phase components frequency characteristics peculiarities.....	27
1.4. Some typical blocks of automatic control systems	28
1.4.1. Amplifying block.....	
1.4.2. Aperiodic inertial component of the first period.....	30
1.4.3. Oscillatory,aperiodic and conservative components.....	30
1.4.4. Astatic differentiated component	30
1.4.5. Differential component.....	
1.5. Block diagrams.....	33
1.5.1. Получение передаточной функции системы автоматического регулирования по передаточным функциям звеньев.....	38
1.5.2. Blocks in series.....	39
	43

1.5.3. Blocks in parallel.....	43
1.5.4. Feedback control system	
1.5.5. Block diagram reduction.....	44
1.5.6. Summing point moving.....	44
1.5.7. Branching point moving.....	
1.5.8. Example of diagrams reduction rules.....	45
1.6. Control system generalized equivalent circuit.....	46
1.6.1. Automatic control system property in steady state.....	46
1.6.2. Proportional controller (P controller).....	47
1.6.3. Proportional derivative controller(PD controller).....	48
1.6.4. Integrated controller (I controller).....	
1.6.5. Proportional integrated controller (PI controller).....	50
1.6.6. Proportional integral-derivative controller (PID controller).....	
1.7. Transient processes calculation.....	54
1.7.1. Transient process calculation in state space	54
1.7.2. Convergence of matrix differential equation to scalar equations...	57
1.7.3. Transient processes calculation with Impulse response function use	57
1.7.4. Analytical method of transient process calculation.....	
1.8. Automatic control linear system stability.....	59
1.8.1. The Routh-Hurwitz stability criterion(algebraic stability criterion)	61
1.8.2. The Routh-Hurwitz algebraic criterion application.....	61
1.8.3. Mikhailov stability criterion.....	
1.8.4. Nyquist stability criterion	68
1.8.5. Logarithmic stability criterion.....	
1.8.6. Application of Nyquist criterion and transient processes quality criteria.....	74
1.8.7. Analysis of controller type and parameters on stability in frequency domain	83

1.9. Stability areas determination.....	85
1.9.1. D decomposition method.....	
1.9.2. Root locus analysis.....	88
1.9.3. Poles placement method.....	90
CHAPTER 2. Non-linear dynamic systems.....	92
2.1. Phase space and dynamic systems phase portraits	102
2.1.1. Phase portraits construction with surface use.....	
2.2. Phase plane method.....	105
2.2.1. Servomotor equation with ideal relay characteristic.....	
2.2.2. Servomotor equation with real relay characteristic.....	107
2.3. Lyapunov straight method.....	112
2.4. Harmonic linearization method.....	112
2.5 Self-exciting oscillations analysis algorithm.....	115
Literature.....	118
Appendix 1.....	121
Appendix 2.....	
Appendix 3.....	121
Appendix 4.....	
Appendix 5.....	131
Appendix 6.....	140
	140
