

ANNOTATION TO THE DISCIPLINE

"PERFORMANCE GEOMETRY AND ENGINEERING GRAPHICS"

Among the disciplines that form the general engineering and general scientific thinking of a specialist, descriptive geometry and engineering graphics can be included with good reason. This discipline not only inculcates the skills of constructing images of various material objects, including geological and geological, but it is also the starting point for studying other general engineering (for example, technical and applied mechanics), as well as special disciplines.

This course is aimed at studying the theoretical foundations, methods and techniques for constructing images and performing drawing and graphic works in relation to the tasks of geology, mining and geological exploration.
