

## 3D plot of a surface in Matlab

3D plot of a surface in Matlab

Create a surface of function mesh

Graphics 3-D line plot

Graphics 3-D contour plot

Draw contours in volume slice planes

For 3-D shaded *surface plot* use command:

`surf(Z)`

`surf(Z,C)`

`surf(X,Y,Z)`

`surf(X,Y,Z,C)`

`surf(...,'PropertyName',PropertyValue)`

`surf(axes_handles,...)`

`h = surf(...)`

**surf(Z)** creates a three-dimensional shaded surface from the z components in matrix **Z**, using  $x = 1:n$  and  $y = 1:m$ , where  $[m,n] = \text{size}(Z)$ . The height, **Z**, is a single-valued function defined over a geometrically rectangular grid. **Z** specifies the color data, as well as surface height, so color is proportional to surface height.

**surf(Z,C)** plots the height of **Z**, a single-valued function defined over a geometrically rectangular grid, and uses matrix **C**, assumed to be the same size as **Z**, to color the surface. See Coloring Mesh and Surface Plots for information on defining **C**.

**surf(X,Y,Z)** uses **Z** for the color data and surface height. **X** and **Y** are vectors or matrices defining the x and y components of a surface. If **X** and **Y** are vectors,  $\text{length}(X) = n$  and  $\text{length}(Y) = m$ , where  $[m,n] = \text{size}(Z)$ . In this case, the vertices of the surface faces are  $(X(j), Y(i), Z(i,j))$  triples. To create **X** and **Y** matrices for arbitrary domains, use the `meshgrid` function.

**surf(X,Y,Z,C)** uses **C** to define color. MATLAB® performs a linear transformation on this data to obtain colors from the current colormap.

**surf(...,'PropertyName',PropertyValue)** specifies surface properties along with the data. For a list of properties, see Chart Surface Properties.

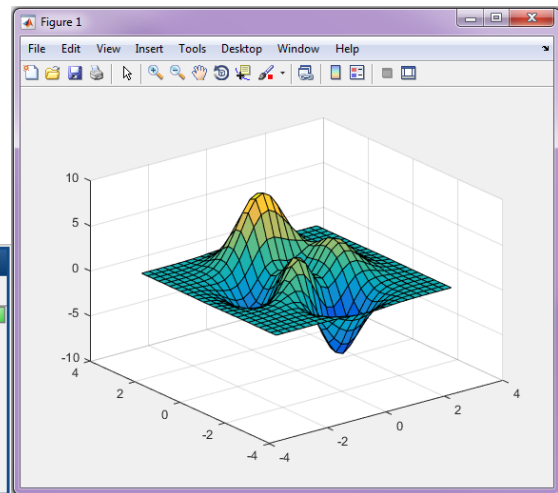

**surf(axes\_handles,...)** plots into the axes with handle `axes_handle` instead of the current axes (`gca`).

`h = surf(...)` returns a handle to a chart surface graphics object.

```

### **Mesh plot**

`mesh(X,Y,Z)`

`mesh(Z)`

`mesh(...,C)`

`mesh(...,'PropertyName',PropertyValue,...)`

`mesh(axes_handles,...)`

`h = mesh(...)`

**mesh**(X,Y,Z) draws a wireframe mesh with color determined by Z, so color is proportional to surface height. If X and Y are vectors,  $\text{length}(X) = n$  and  $\text{length}(Y) = m$ , where  $[m,n] = \text{size}(Z)$ . In this case,  $(X(j), Y(i), Z(i,j))$  are the intersections of the wireframe grid lines; X and Y correspond to the columns and rows of Z, respectively. If X and Y are matrices,  $(X(i,j), Y(i,j), Z(i,j))$  are the intersections of the wireframe grid lines.

**mesh**(Z) draws a wireframe mesh using  $X = 1:n$  and  $Y = 1:m$ , where  $[m,n] = \text{size}(Z)$ . The height, Z, is a single-valued function defined over a rectangular grid. Color is proportional to surface height.

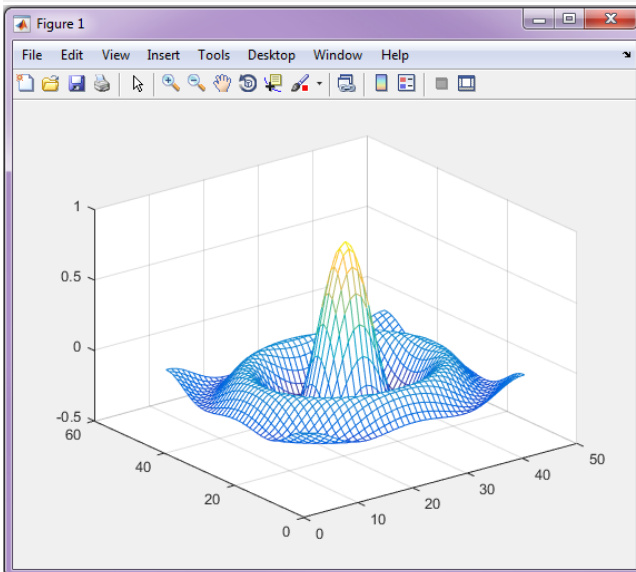

**mesh**(...,C) draws a wireframe mesh with color determined by matrix C. MATLAB® performs a linear transformation on the data in C to obtain colors from the current colormap. If X, Y, and Z are matrices, they must be the same size as C.

**mesh**(..., 'PropertyName', PropertyValue,...) sets the value of the specified surface property. Multiple property values can be set with a single statement.

**mesh**(axes\_handles,...) plots into the axes with handle axes\_handle instead of the current axes (gca).

**h** = **mesh**(...) returns a handle to a Chart Surface Properties graphics object.

### 3-D line plot

- `plot3(X1,Y1,Z1,...)`
- `plot3(X1,Y1,Z1,LineStyle,...)`
- `plot3(...,'PropertyName',PropertyValue,...)`
- `plot3(axes_handle,...)`
- `h = plot3(...)`

The `plot3` function displays a three-dimensional plot of a set of data points.

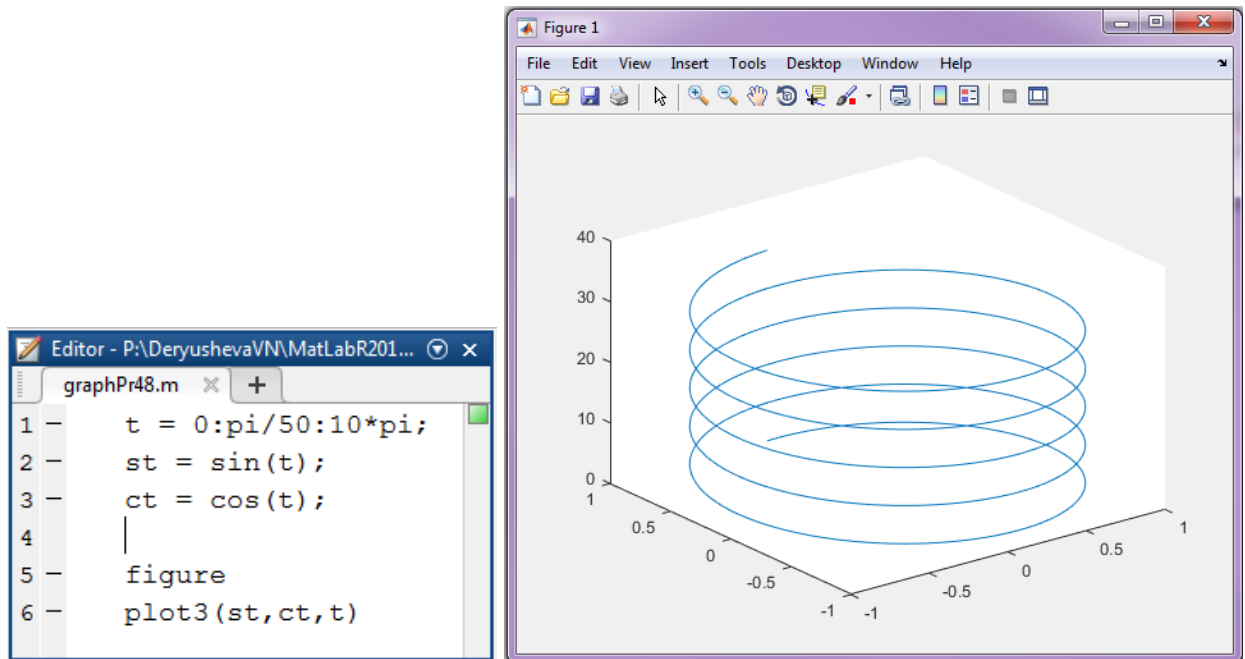

**`plot3(X1,Y1,Z1,...)`**, where `X1`, `Y1`, `Z1` are vectors or matrices, plots one or more lines in three-dimensional space through the points whose coordinates are the elements of `X1`, `Y1`, and `Z1`.

**`plot3(X1,Y1,Z1,LineStyle,...)`** creates and displays all lines defined by the `Xn`, `Yn`, `Zn`, `LineStyle` quads, where `LineStyle` is a line specification that determines line style, marker symbol, and color of the plotted lines.

**`plot3(...,'PropertyName',PropertyValue,...)`** sets line properties to the specified property values for all the charting lines created by `plot3`. See *Chart Line Properties* for a description of the properties you can set.

**`plot3(axes_handle,...)`** plots into the axes specified by `axes_handle` instead of into the current axes (`gca`). The option, `axes_handle` can precede any of the input combinations in the previous syntaxes.

**h = plot3(...)** returns a column vector of charting line handles, with one handle per object.

### ***3-D contour plot***

`contour3(Z)`  
`contour3(Z,n)`  
`contour3(Z,v)`  
`contour3(X,Y,Z)`  
`contour3(X,Y,Z,n)`  
`contour3(X,Y,Z,v)`  
`contour3(...,LineStyle)`  
`contour3(...,Name,Value)`  
`contour3(ax,...)`  
`[C,h] = contour3(...)`

**contour3** creates a 3-D contour plot of a surface defined on a rectangular grid.

**contour3(Z)** draws a contour plot of matrix **Z** in a 3-D view. **Z** is interpreted as heights with respect to the x-y plane. **Z** must be at least a 2-by-2 matrix that contains at least two different values. The x values correspond to the column indices of **Z** and the y values correspond to the row indices of **Z**. The contour levels are chosen automatically.

**contour3(Z,n)** draws a contour plot of matrix **Z** with **n** contour levels in a 3-D view.

**contour3(Z,v)** draws a contour plot of matrix **Z** with contour lines at the values specified in vector **v**. The number of contour levels is equal to `length(v)`. Specifying the vector **v** sets the `LevelListMode` property to manual. To display a single contour line at a particular value, define

$v$  as a two-element vector with both elements equal to the desired contour level. For example, to draw a single contour of level  $k$ , use `contour3(Z,[k k])`.

**contour3(X,Y,Z)**, **contour3(X,Y,Z,n)**, and **contour3(X,Y,Z,v)** draw contour plots of  $Z$  using  $X$  and  $Y$  to determine the  $x$  and  $y$  values.

If  $X$  and  $Y$  are vectors, then `length(X)` must equal `size(Z,2)` and `length(Y)` must equal `size(Z,1)`. The vectors must be strictly increasing or strictly decreasing and cannot contain any repeated values.

If  $X$  and  $Y$  are matrices, then their sizes must equal the size of  $Z$ . Typically, you should set  $X$  and  $Y$  so that the columns are strictly increasing or strictly decreasing and the rows are uniform (or the rows are strictly increasing or strictly decreasing and the columns are uniform).

If  $X$  or  $Y$  is irregularly spaced, then `contour3` calculates contours using a regularly spaced contour grid, and then transforms the data to  $X$  or  $Y$ .

**contour3(...,LineStyle)** draws the contour lines using the line type and color specified by `LineStyle`. `contour3` ignores marker symbols.

**contour3(...,Name,Value)** specifies contour properties using one or more property name, property value pairs. `Name` is the property name and must appear inside single quotes (`'`). `Value` is the corresponding value. For example, `'LineWidth',2` sets the contour line width to 2. For a list of contour property names and values, see `Contour Properties`.

**contour3(ax,...)** plots into the axes specified by `ax` instead of into the current axes (`gca`).

**[C,h] = contour3(...)** returns the contour matrix  $C$  containing the data that defines the contour lines and the contour object  $h$ . The `clabel` function uses the contour matrix to label the contour lines.

```

Editor - P:\DeryushevaVN\MatLabR2014b\MM_...
graphPr45.m
1 - x = -2:0.25:2;
2 - [X,Y] = meshgrid(x);
3 - Z = X.*exp(-X.^2-Y.^2);
4 - contour3(X,Y,Z,30)

```

***Draw contours in volume slice planes***

`contourslice(X,Y,Z,V,Sx,Sy,Sz)`

`contourslice(X,Y,Z,V,Xi,Yi,Zi)`

`contourslice(V,Sx,Sy,Sz)`

`contourslice(V,Xi,Yi,Zi)`

`contourslice(...,n)`

`contourslice(...,cvals)`

`contourslice(...,[cv cv])`

`contourslice(...,'method')`

`contourslice(axes_handle,...)`

`h = contourslice(...)`

**contourslice**(X,Y,Z,V,Sx,Sy,Sz) draws contours in the x-, y-, and z-axis aligned planes at the points in the vectors Sx, Sy, Sz. The arrays X, Y, and Z define the coordinates for the volume V and must be monotonic and represent a Cartesian, axis-aligned grid (such as the data produced by `meshgrid`). The color at each contour is determined by the volume V, which must be an m-by-n-by-p volume array.

**contourslice**(X,Y,Z,V,Xi,Yi,Zi) draws contours through the volume V along the surface defined by the 2-D arrays Xi,Yi,Zi. The surface should lie within the bounds of the volume.

**contourslice**(V,Sx,Sy,Sz) and **contourslice**(V,Xi,Yi,Zi) (omitting the X, Y, and Z arguments) assume `[X,Y,Z] = meshgrid(1:n,1:m,1:p)`, where `[m,n,p] = size(v)`.

**contourslice**(...,n) draws n contour lines per plane, overriding the automatic value.

**contourslice**(...,cvals) draws `length(cval)` contour lines per plane at the values specified in vector cvals.

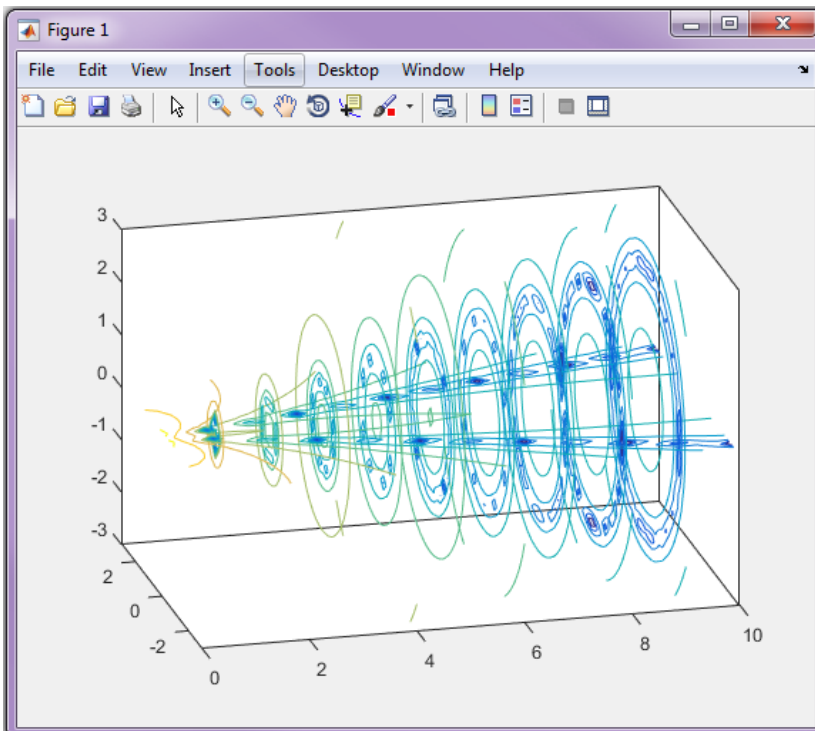

**contourslice**(...,[cv cv]) computes a single contour per plane at the level cv.

**contourslice**(...,'method') specifies the interpolation method to use. method can be linear, cubic, or nearest. nearest is the default except when the contours are being drawn along the surface defined by Xi, Yi, Zi, in which case linear is the default. (See `interp3` for a discussion of these interpolation methods.)

**contourslice**(axes\_handle,...) plots into the axes with the handle axes\_handle instead of into the current axes (`gca`).

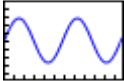

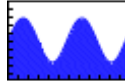

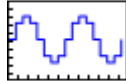

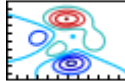

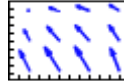

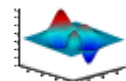

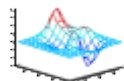

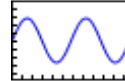

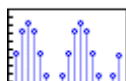

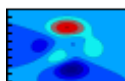

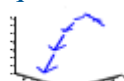

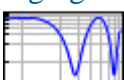

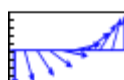

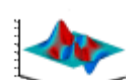

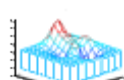

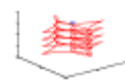

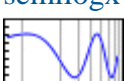

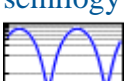

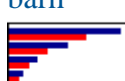

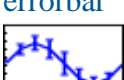

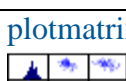

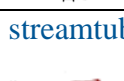

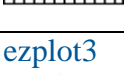

**h = contourslice**(...) returns a vector of handles to patch objects that are used to implement the contour lines.
